HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

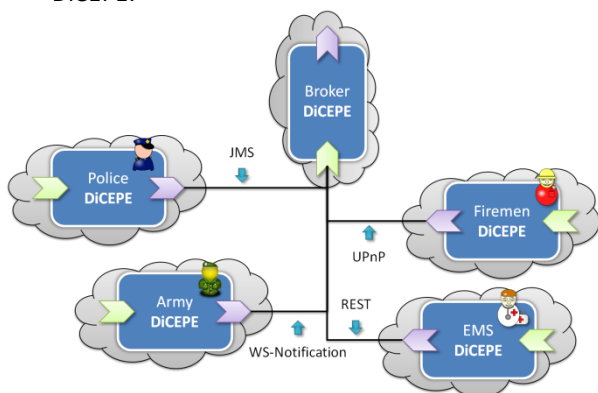

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction

- DiCEPE (Distributed Complex Event Processing) is a platform that focuses on the integration of CEP engines in distributed systems, and which is capable of using various communication protocols.
- It was built using a component-based approach, and inherits the flexibility and adaptation facilities provided by FraSCaTi.
- The DiCEPE platform is used to federate complex event processing.

Experimental Deployment

- We developed a solution for a crisis management scenario using DiCEPE .
- This scenario was deployed in a cloud environment using CloudBees, a public Platform as a Service (PaaS) provider.
- Each actor of the scenario runs its own instance of DiCEPE.

Platform Overview

- The architecture of DiCEPE is composed of four parts:
- **Engine:** This component acts as the engine instance, by which Statement components, events, and outputs (Listener component) are registered.
- **Statement:** This component is used for querying the inbound event streams. It is registered within the Engine component, which at the same time is connected to one or many Statement components.
- **Listener:** This component generates a new complex event when an action is detected.
- **Context:** This component collects information of the executing environment, like the number of statement rules deployed in the engine at run-time.

Scalability

- To evaluate the scalability, we used two different datasets of event generators: one with 10,000 and a second one with 15,000 which generated around 500,000 and 750,000 events respectively.
- As shown in the graphs, the processing time for each event remained stable and very low during both benchmarks (around a 10th of a millisecond), despite the fact that the average number of simultaneous sessions had a significant increase of about 50% (from 89 with the first dataset, to 135 with the second).

Integration

- The DiCEPE platform facilitates the integration of complex event processing engines.
- We integrated DiCEPE with the Esper and Etalis CEP engines.

Conclusion

- DiCEPE is a platform that offers interoperability for Distributed Complex Event Processing engines, via federation. It focuses on providing a very flexible component architecture, which supports the interaction of different complex event processing engines simultaneously, while enabling communication among them with a distributed execution and deployment system.
